to become easily deficient at the onset of PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.

Time-course changes in blood concentrations of water-soluble vitamins and homocysteine one of the causative factors of PU development. In patients who have developed PU, the deficiency of water-soluble V may be one of the causative factors of PU development. In patients who have developed PU, supplementation of water-soluble V is desirable for ulcer prevention.
